do i really need to do this as in neon i have the data i mean the database is deployed on neon

Clarified database setup requirements and verification methods

Yes, you do — having a Neon *project* just gives you an empty PostgreSQL instance. It doesn't have any tables yet (no `users`, `researches`, `research_reports`). Those tables only get created when Prisma's migration actually runs against it. Right now, if you try to register a user or run research, it'll fail with an error like `relation "users" does not exist`.

Easiest way to confirm this yourself, no guessing needed:

1. Go to `console.neon.tech` → open your project.

2. Click SQL Editor in the left sidebar (this is free, no paid plan needed).

3. Run:

sql

`SELECT table_name FROM information_schema.tables WHERE table_schema = 'public';`

4. If that returns **nothing** (empty result), your tables don't exist yet — you need the migration.

5. If it already lists `users`, `researches`, `research_reports`, or `research`, someone (or something) has already run the migration.
